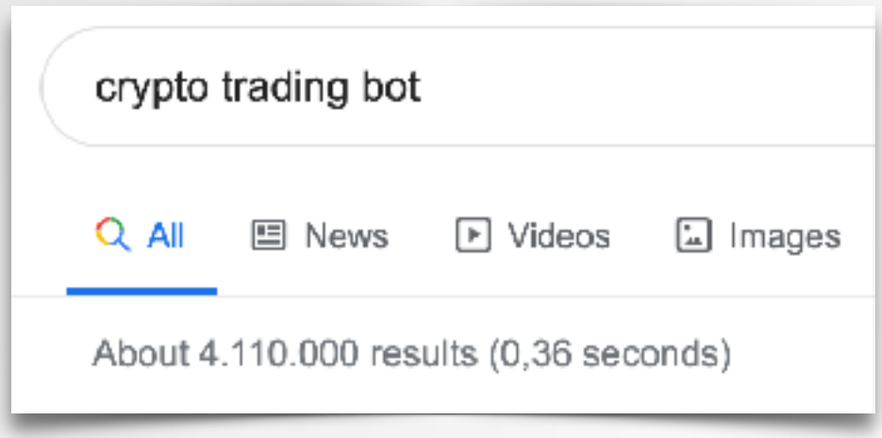
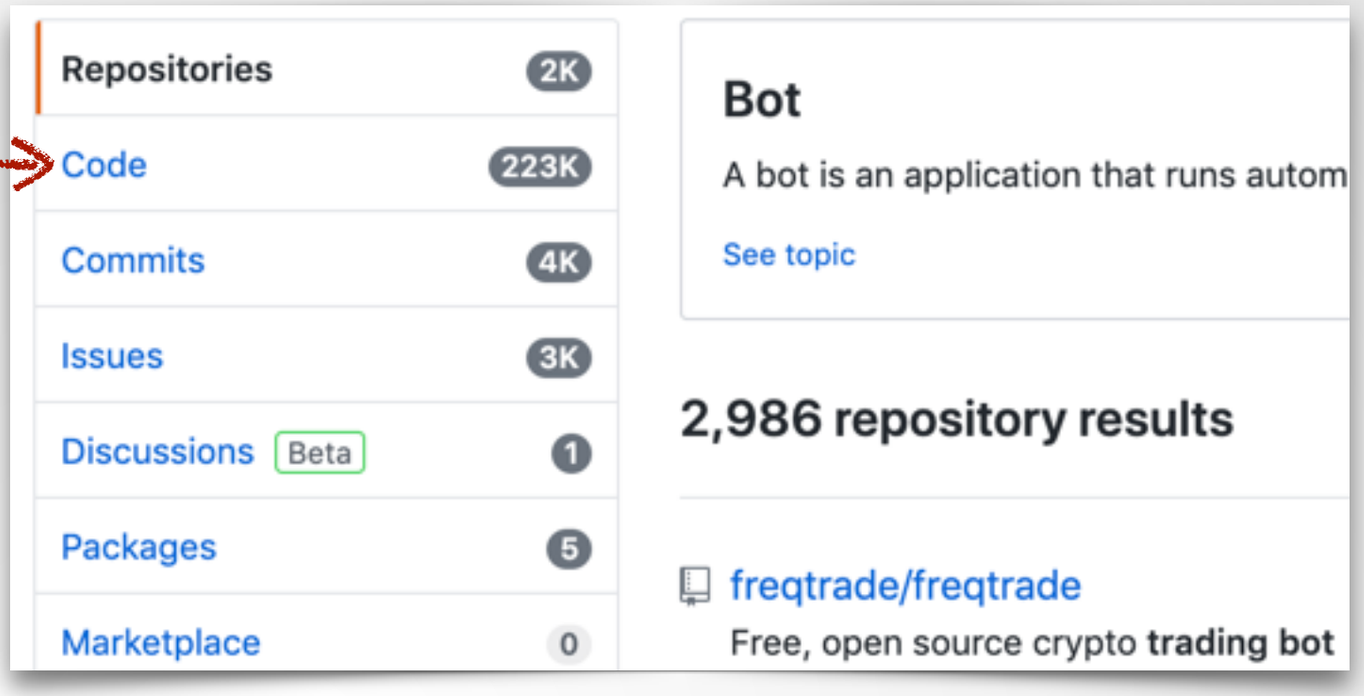
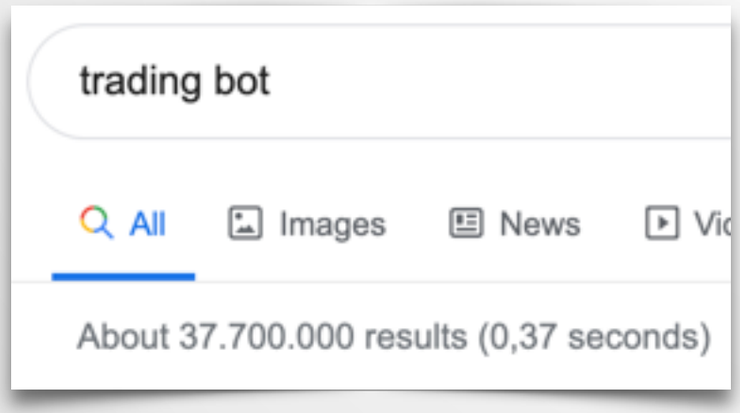
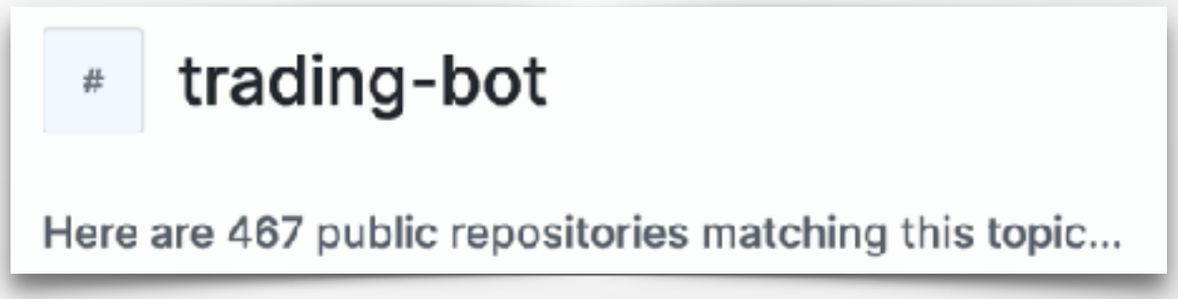
Algorithmic trading



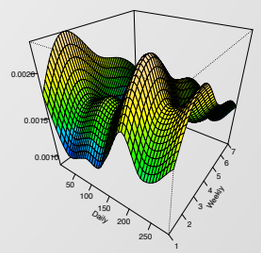


- Smart trading algorithms available, e.g. via Github
- Respective service providers available for 24/7 services
- Market must represent also machine made decisions ! (?)

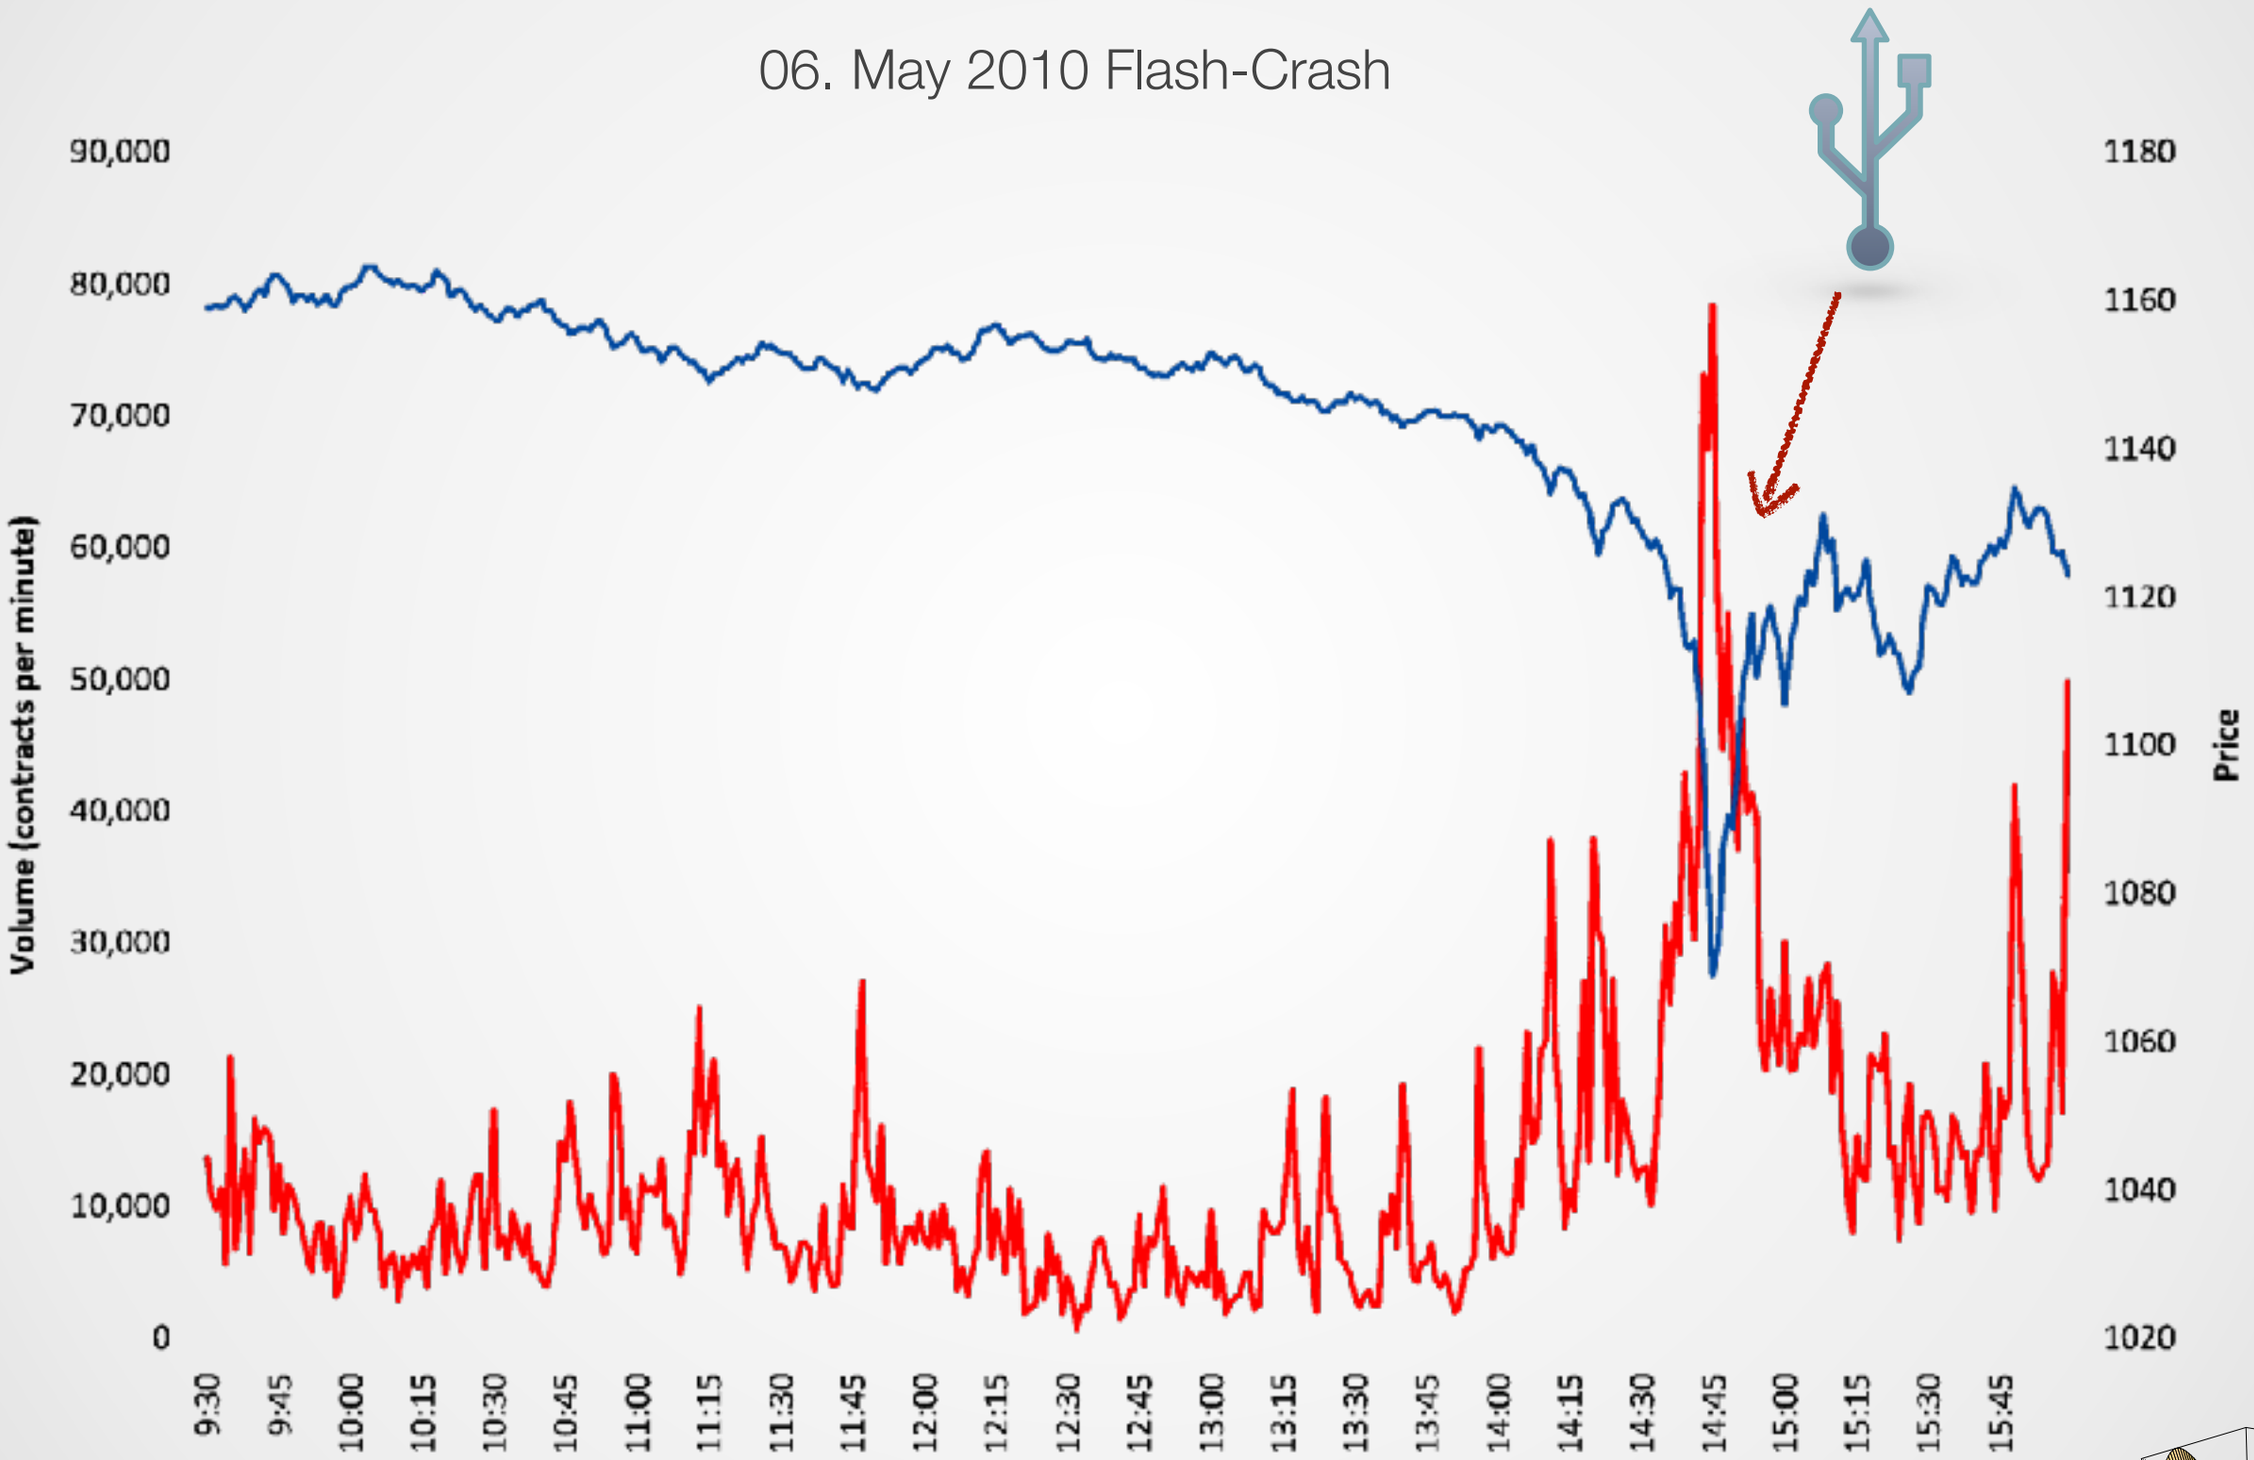




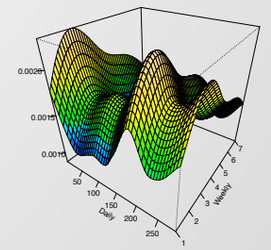
16. APR 2020



Machine made decisions are identifiable!



Price and trading volume of the E-mini S&P 500 stock index futures contract



Behaviour Pattern

"That … it can't be […] *That is not a real price*. Oh well, just go buy Procter. Just go buy Procter […] *they reported a decent quarter, just go buy it.*" (Wetware unknowingly reacts to Software)

("*Is there a hedge fund that is liquidating?*") (Software reacts faster than Wetware)

"*I mean, this is ridi- … this is a good opportunity.*
When I walked down here it was at 61 […] It's at 47 […] (Wetware shuts down Software)
Procter just jumped seven points because I said I liked it at 49." (Wetware reacts to Software)

CNBC - Jim Cramer

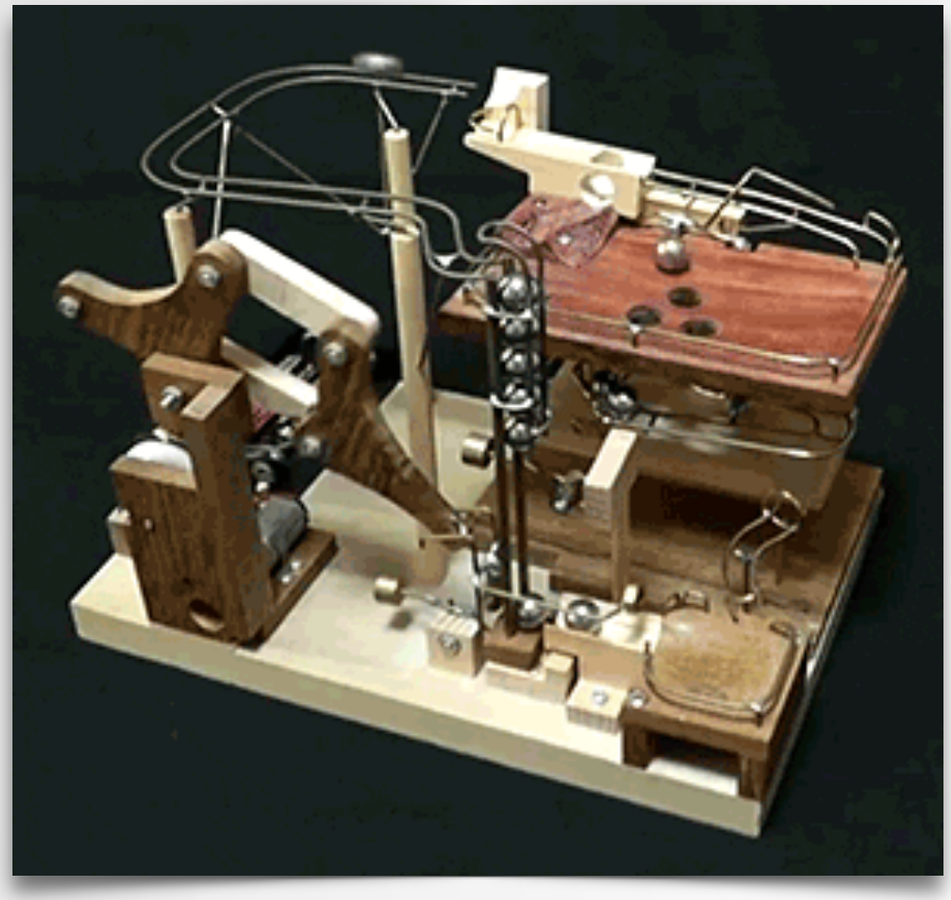
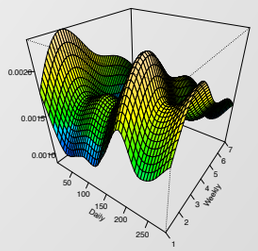
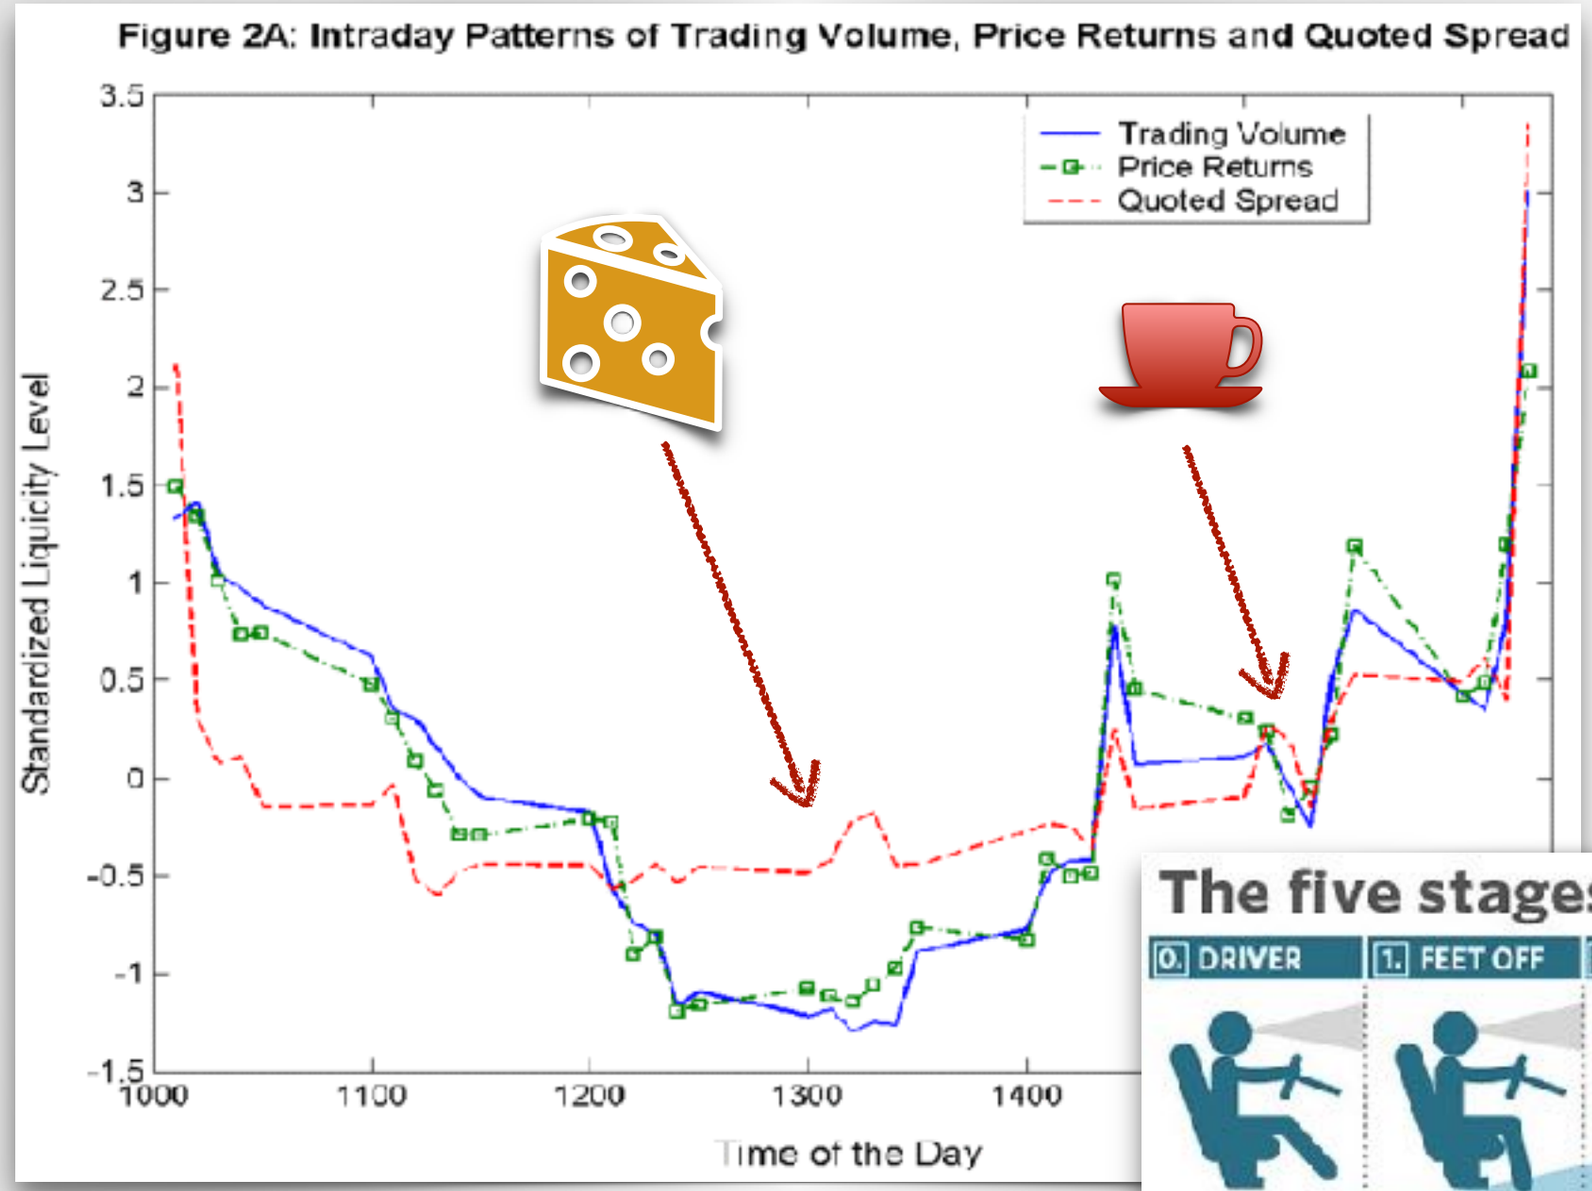
Wetware vs. Software

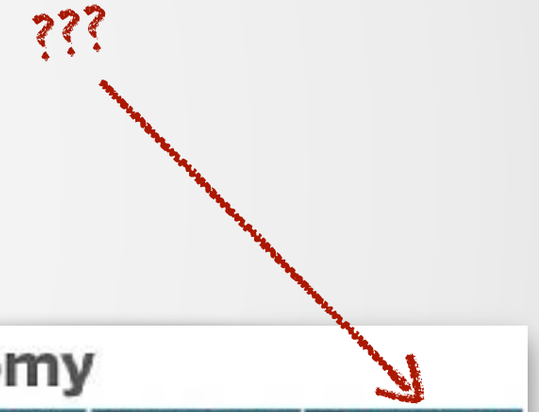


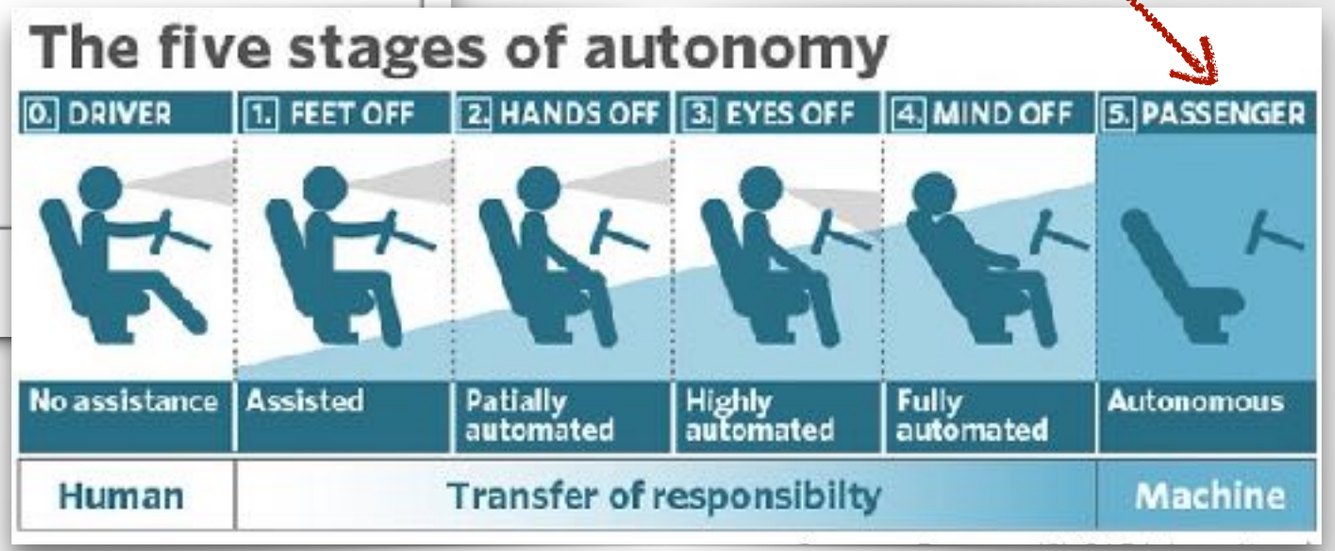
WKH

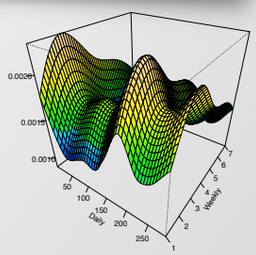


Recognisable intraday trading patterns

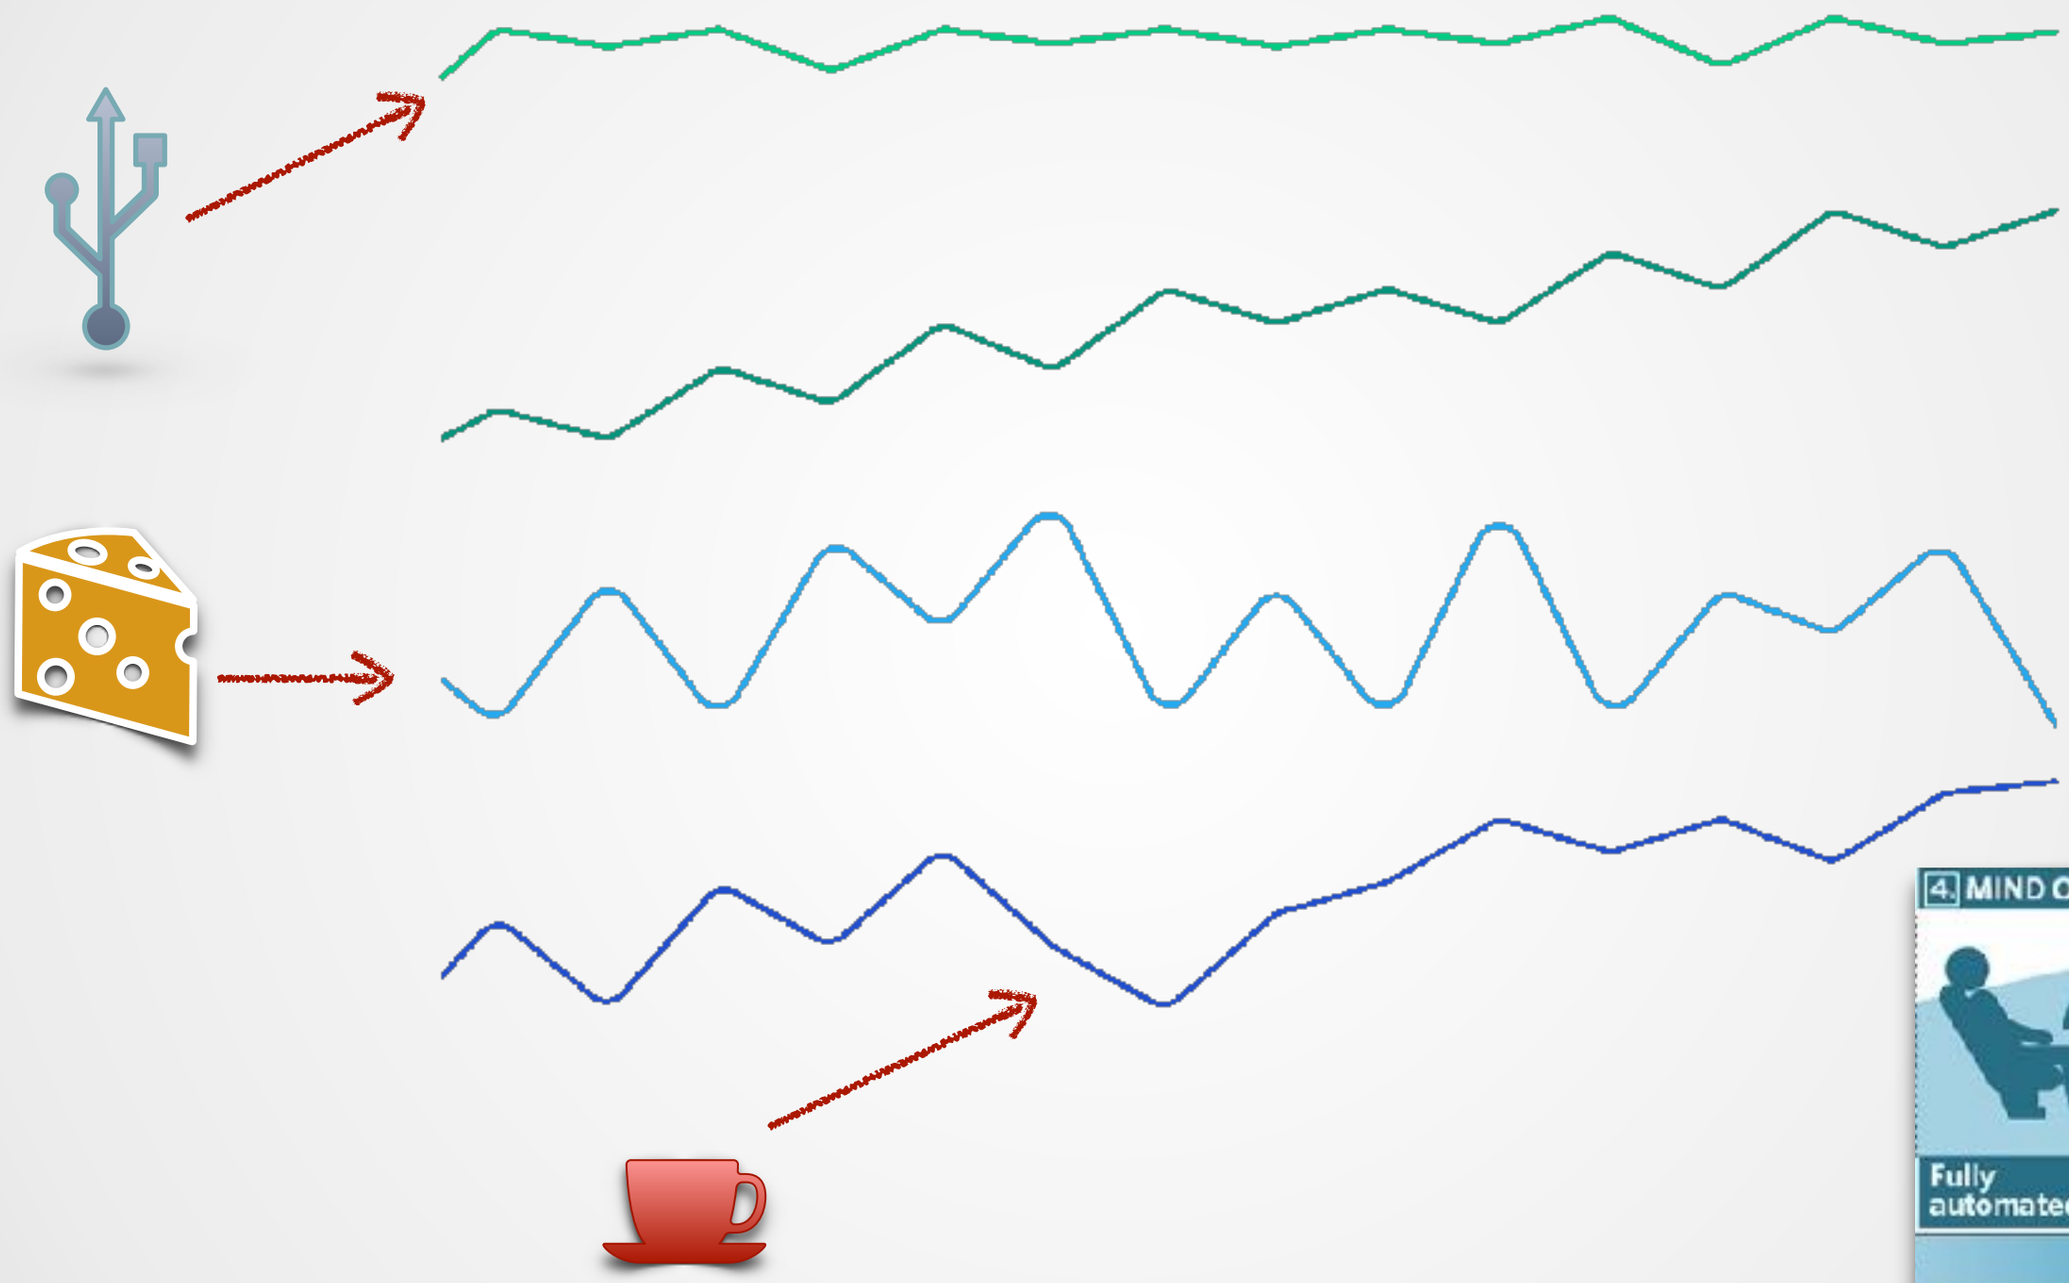


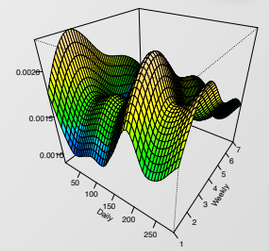






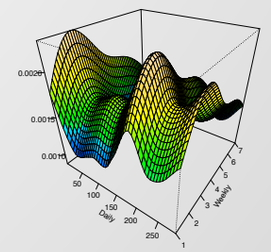
Recognisable intraday trading patterns





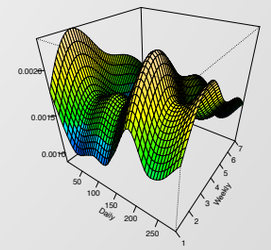
Statistical Challenges

- How to deal with non-classic high frequency cryptocurrency data
- Combine classic methods with digitised economy approaches
- Nonparam Approach? (Add Mod)
- high dimensional parameters, curse of dimensionality
- How 2 id it'd patterns



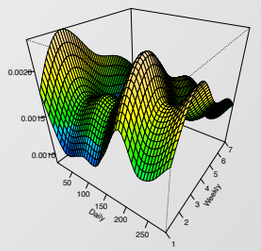
Outline

1. Motivation ✔
2. Decentralized vs. Classic Finance
3. DeFi Market Overview
4. Tech-side of DeFi
5. Data
6. Methodology
7. Empirical Results
8. Time of day effects
9. Conclusion



Systemic Similarities

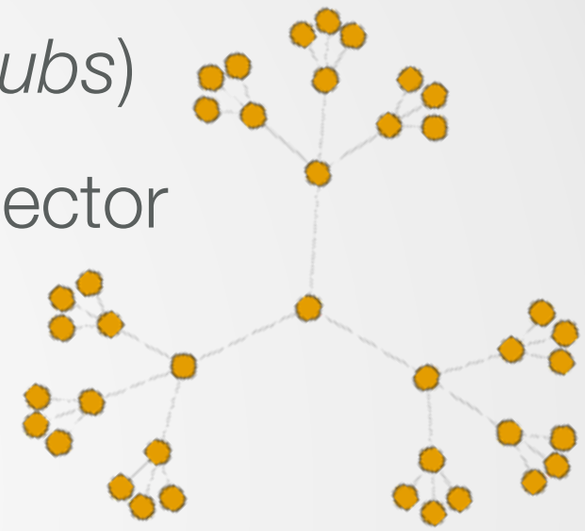
- technology (e.g. ATMs, BC constructions)
- infrastructure (e.g. Accounting, off-chain CC-related backends)
- markets (e.g. Stock / CC exchanges)
- methods (e.g. Sentiment Analysis)
- applications (e.g. algorithm-/oracle-backed Trading / SCs)



Systemic Differences

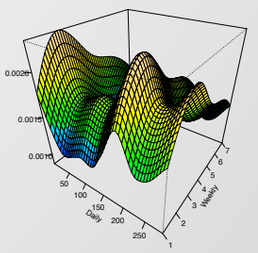
Classic Finance (ClaFi) centralisation (e.g. accounting purposes)

- traditional activity patterns create access points (*hubs*)
- concentration of sufficient tx volume & # in given sector
- concentration of expertise & ressources



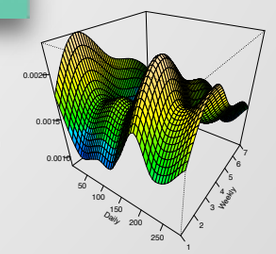
ClaFi de-centralisation meeting supply & demand (e.g. cash value)

- locally (e.g. also domestically)
- regionally (“)
- global

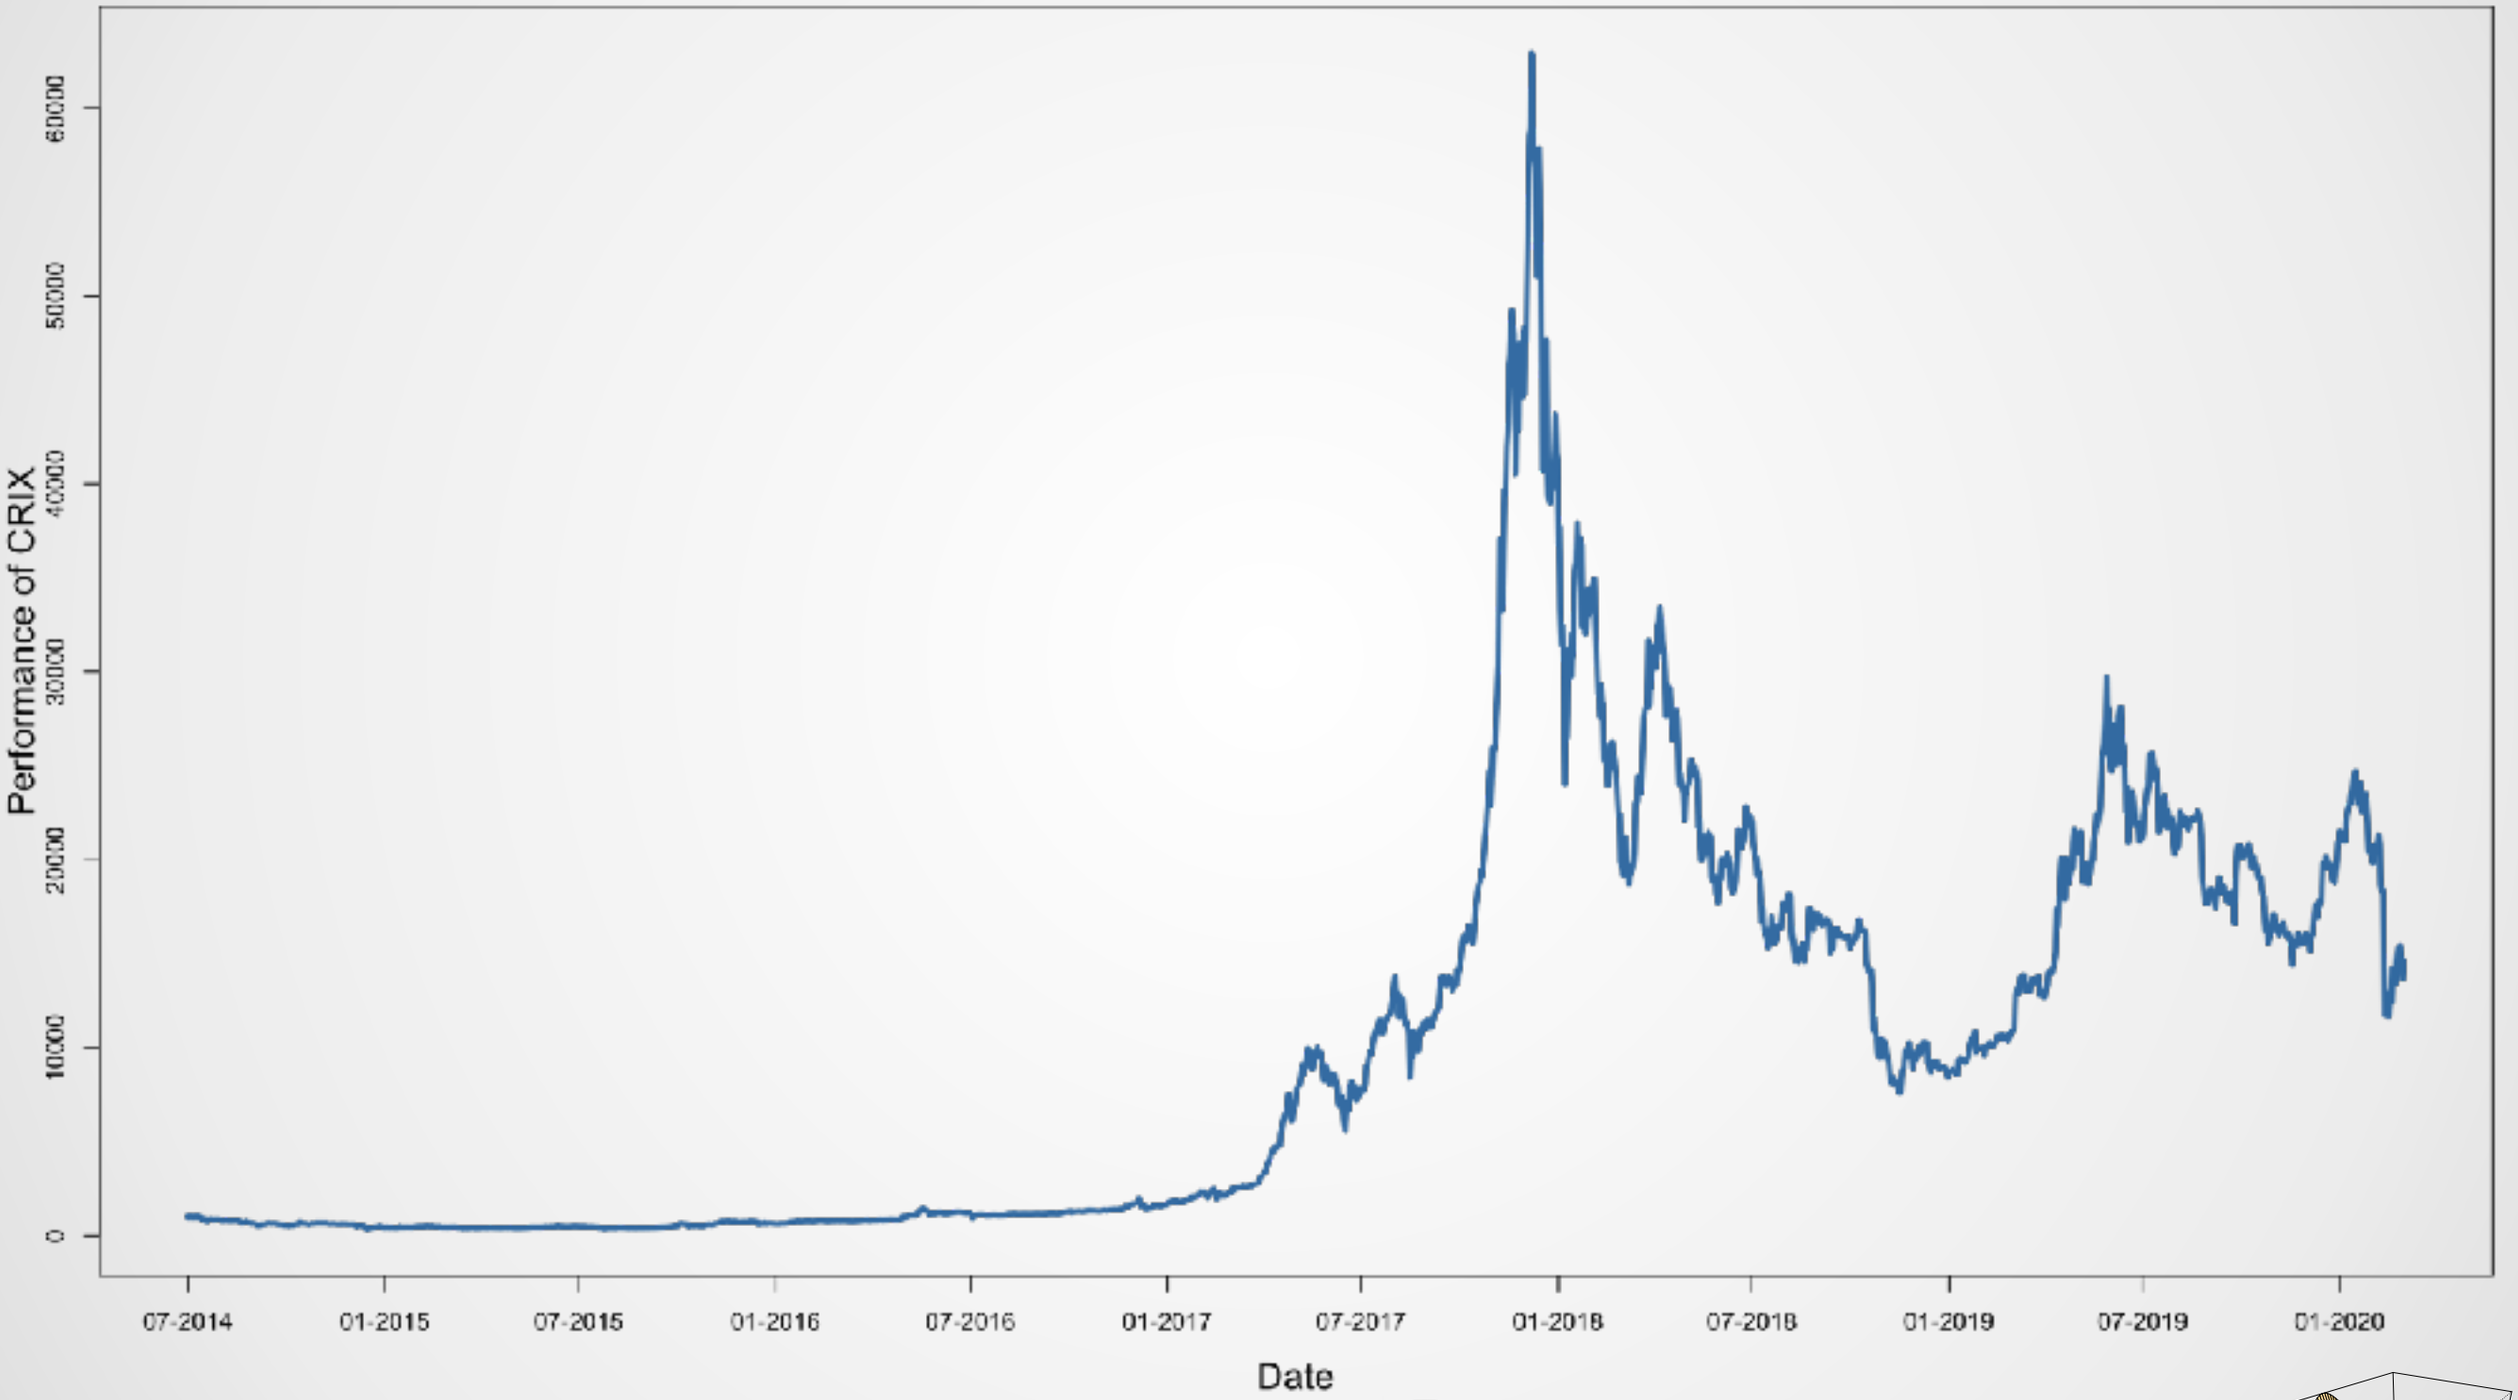


Decentralized Finance

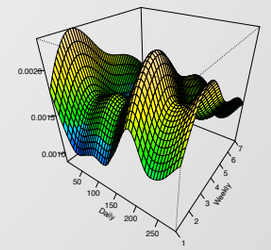
- scalability via tech, not through hubs
- no need to adjust to language, information, and law
- no need for costly means to access (e.g. bank branch)
- no geopolitical dependencies & influence over financial assets
- reduced human-based dependencies (e.g. Algo-driven trading)



Benchmark CRIX

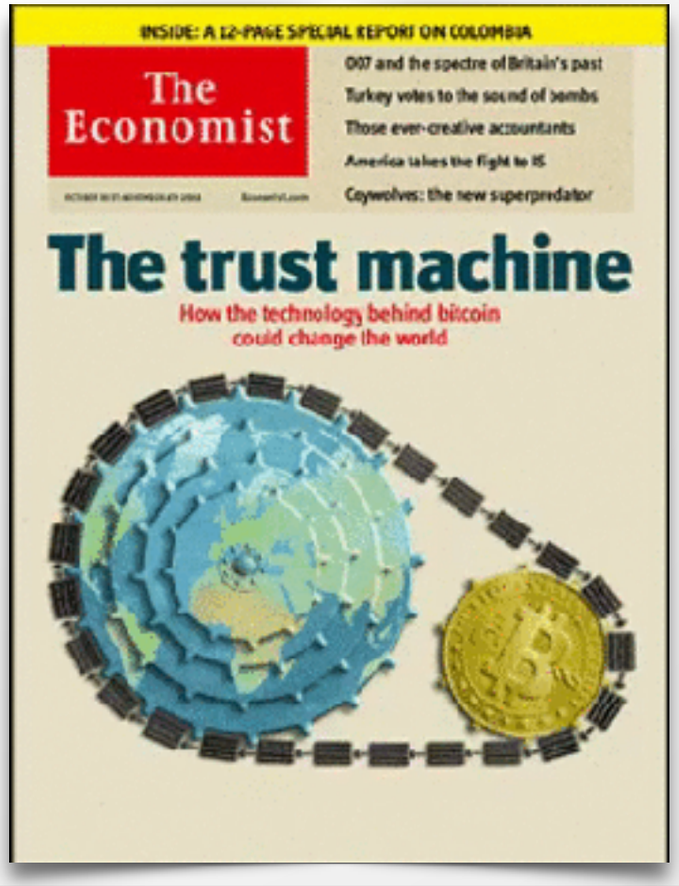


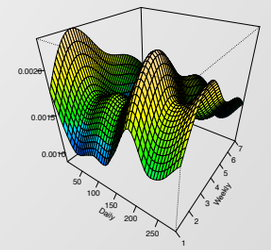
thecrix.de



DeFi B-Side = Pre-destined for machine rule ! (?)

- Hardware Visualisation (Moore's Law, Kryder's Law, Neuland Law)
- ABCD = DNA of DeFi
  - AI Artificial Intelligence (mimics human cognitive functions)
  - BC BlockChain, DLT Distributed Ledger Tech, SC Smart Contracts
  - Cloud Services (computing, storage)
  - Data Analytics (*Fourth Industrial Revolution*, SDA, IoT, etc.)
- CC Crypto-Currencies as DeFi

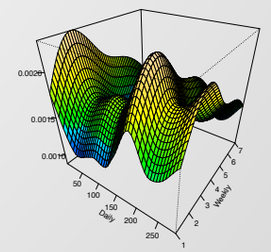




Data Sources

- CRIX 5 min data
  - Time frame: 20180601 - 20180930 (0 GMT)

- 8 CCs 5 min candles data (Europe-based source):
  - BCH, BTC, DASH, ETC, ETH, LTC, REP, STR
  - Time frame: 20180601 - 20180930 (+1 GMT)
  - Sources: dyos solutions GmbH dyos



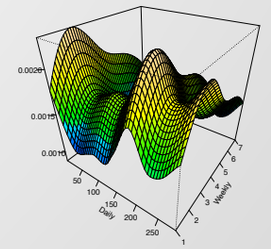
Generalized Additive Model (GAM)

- Hastie, T. J.; Tibshirani, R. J. (1990)

$$G\left\{E\left(y_i\right)\right\} = \beta_0 + f_1\left(x_{i1}\right) + \cdots + f_p\left(x_{ip}\right)$$

  - $y = \left(y_1, \ldots, y_n\right)^\top$ observation of dependent variable $\boldsymbol{Y}$, e.g. returns, volatility, volume
  - β_0 - an intercept
  - $(x_{i1}, \ldots, x_{ip})^\top$ predictor variables (daily and weekly effects)
  - link function $\boldsymbol{G}$ (identical, logarithmic or inverse)
  - $f_1\left(x_{i1}\right) \ldots f_p\left(x_{ip}\right)$ smooth functions (splines) with dimension k_q and basis $b_j^q(x)$ function

$$f_q(x) = \sum_{j=1}^{k_q} \beta_{q,j} b_j^q(x)$$



GAM ctd.

- Loss function

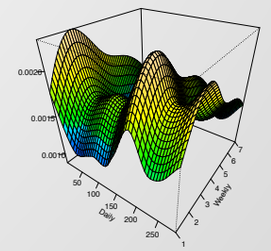
$$\sum_{i=1}^{n}\left(y_i - \sum_{q=1}^{p} f_q\left(x_i\right)\right)^2 + \sum_{q=1}^{p}\lambda_q \int \left\| f_q''(x) \right\|^2 dx$$

where λ_q is a smoothing parameter

$$\widehat{\beta} = \arg\min_{\lambda,\beta}\left\{ \|Y - B\beta\|^2 + \sum_{q=1}^{p}\lambda_q \beta^{\top} S_q \beta \right\}$$

where S_q is a matrix of known coefficients and B is a matrix of $b_j^q(x)$

- Method - P-IRLS: Penalized Iteratively Re-weighted Least Squares



General Statistics

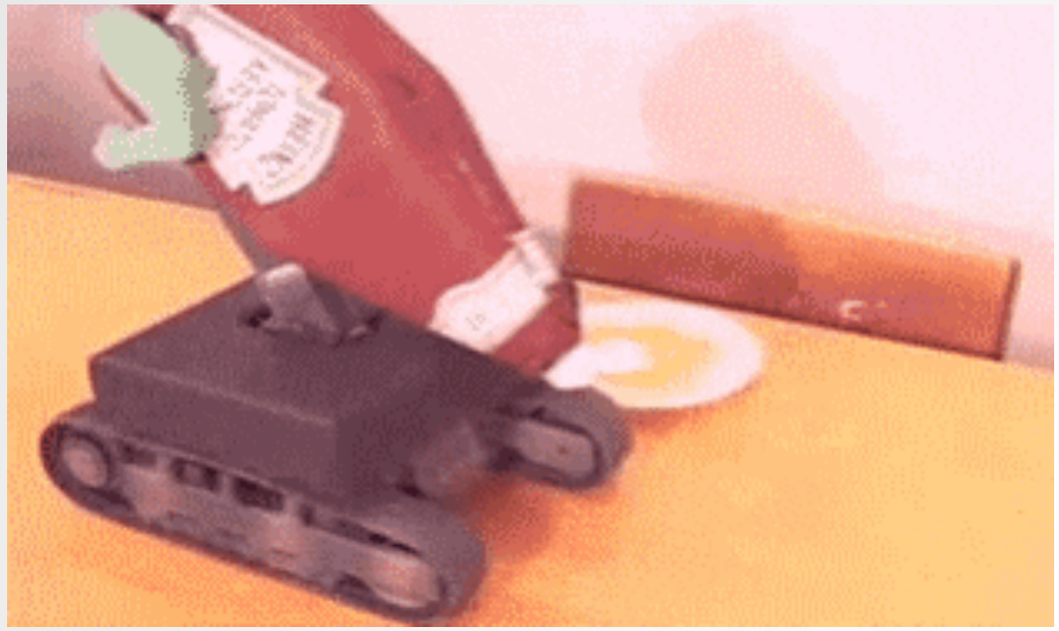
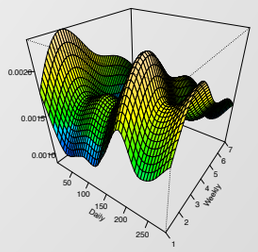
Conclusions



24/7 algorithmic cryptocurrency trade negligible.
People don’t trust the machines.



Thank you!

谢谢

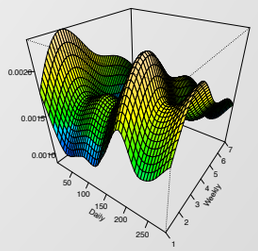
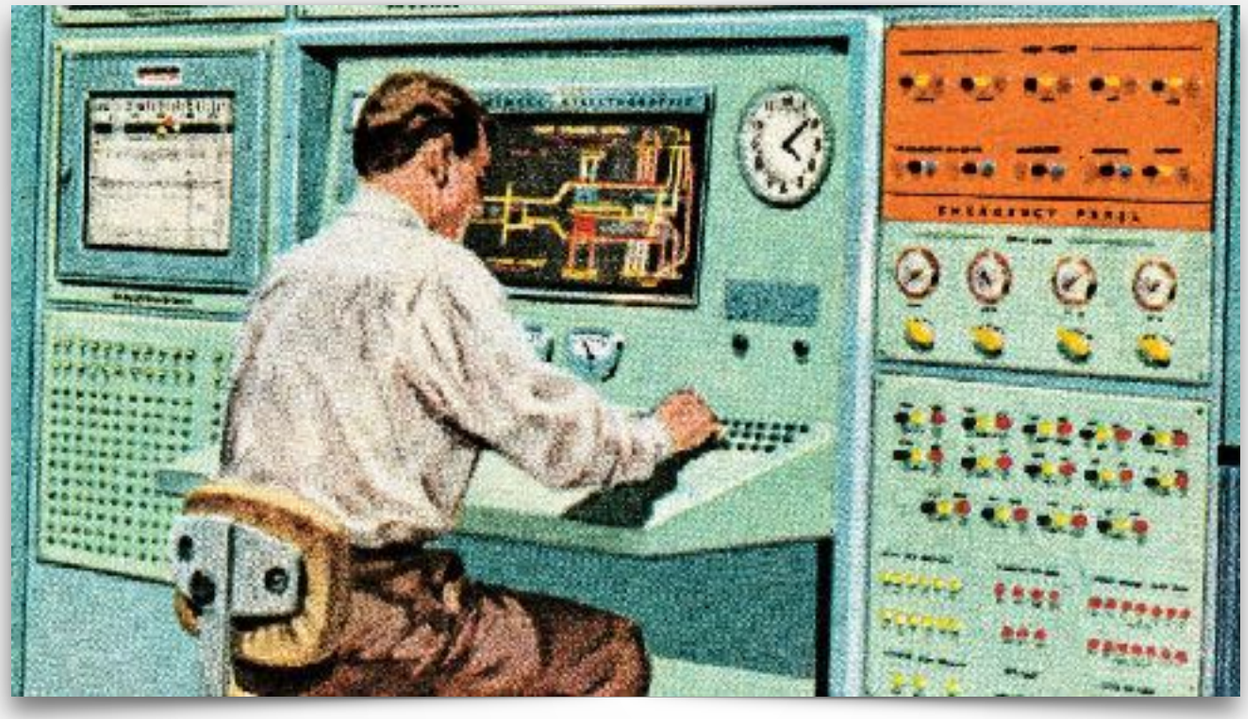
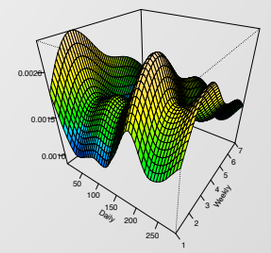
- Exponential increase in computing power
- Automation of whole industries
- 24/7 on-line services for and used by everyone ?



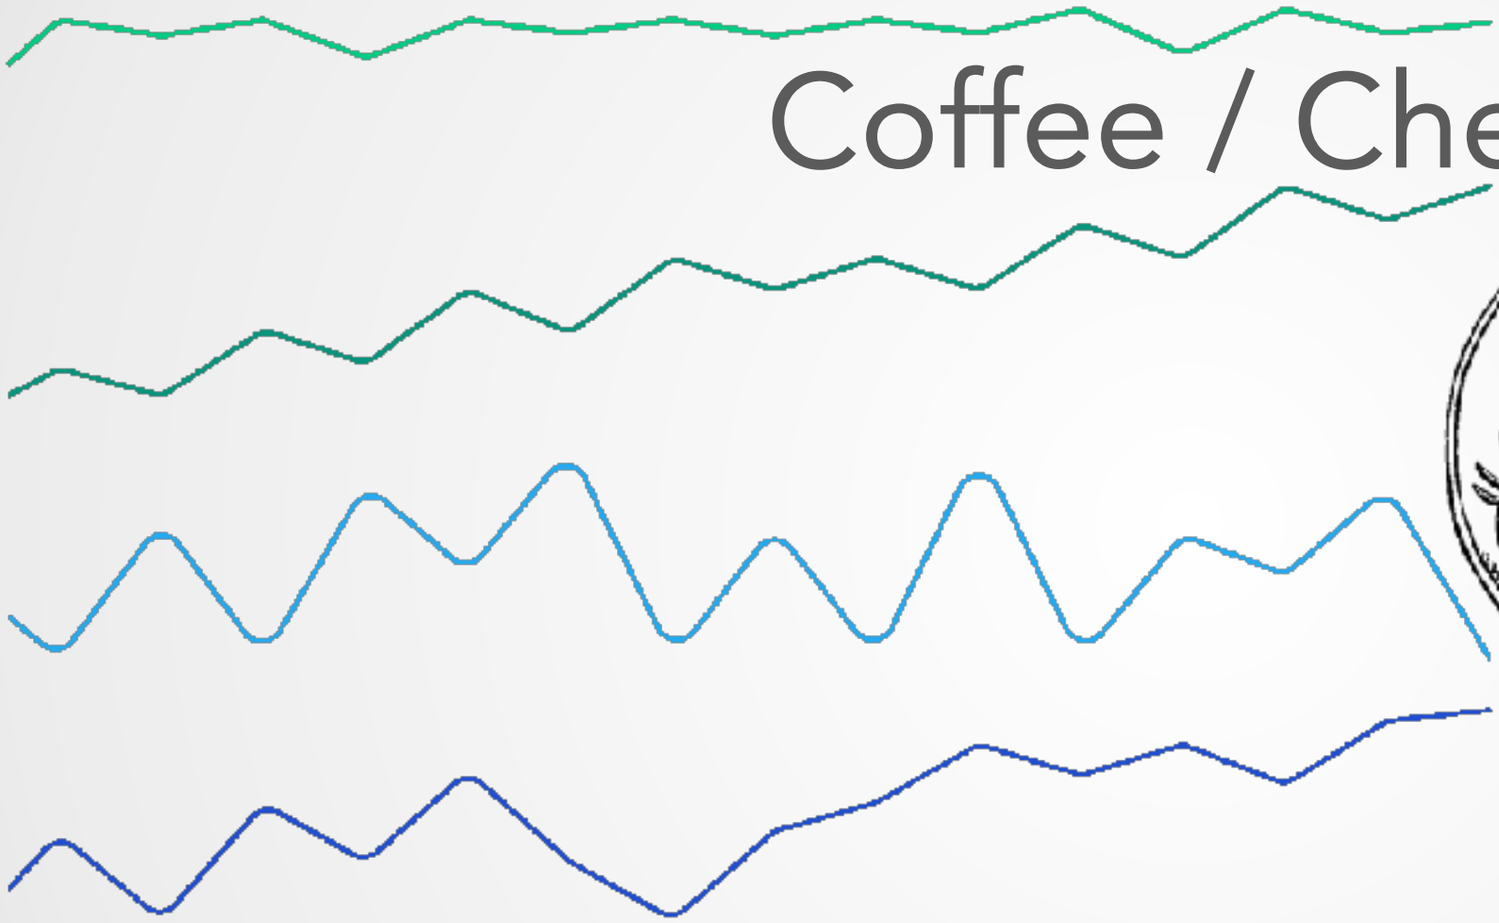
Algorithmic trading

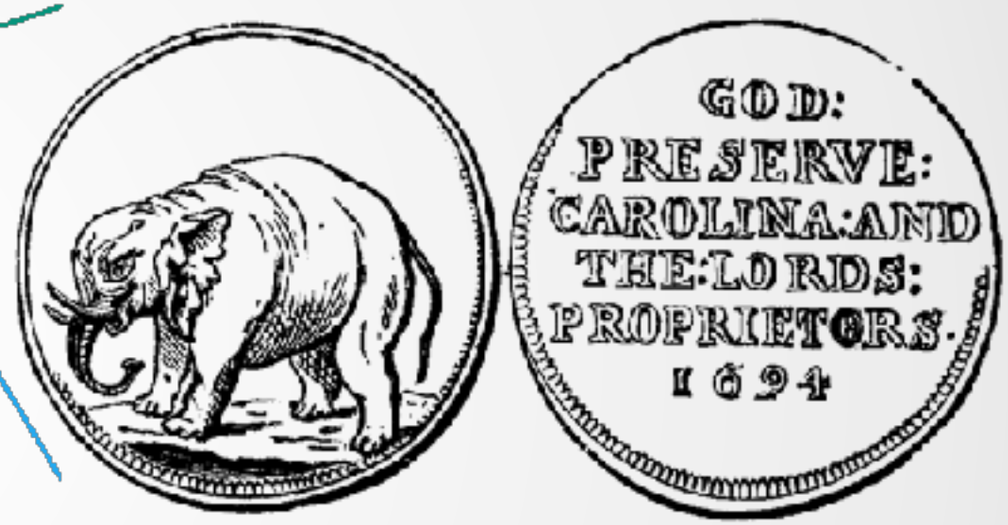


- Smart trading algorithms available, e.g. via Github
- Respective service providers available for 24/7 services
- Must entail machine made decisions ! (?)



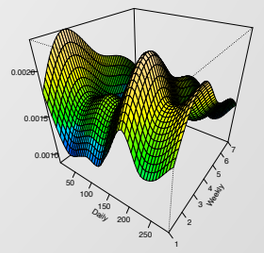
Elephant Test: Digital markets ruled by machines! (?)





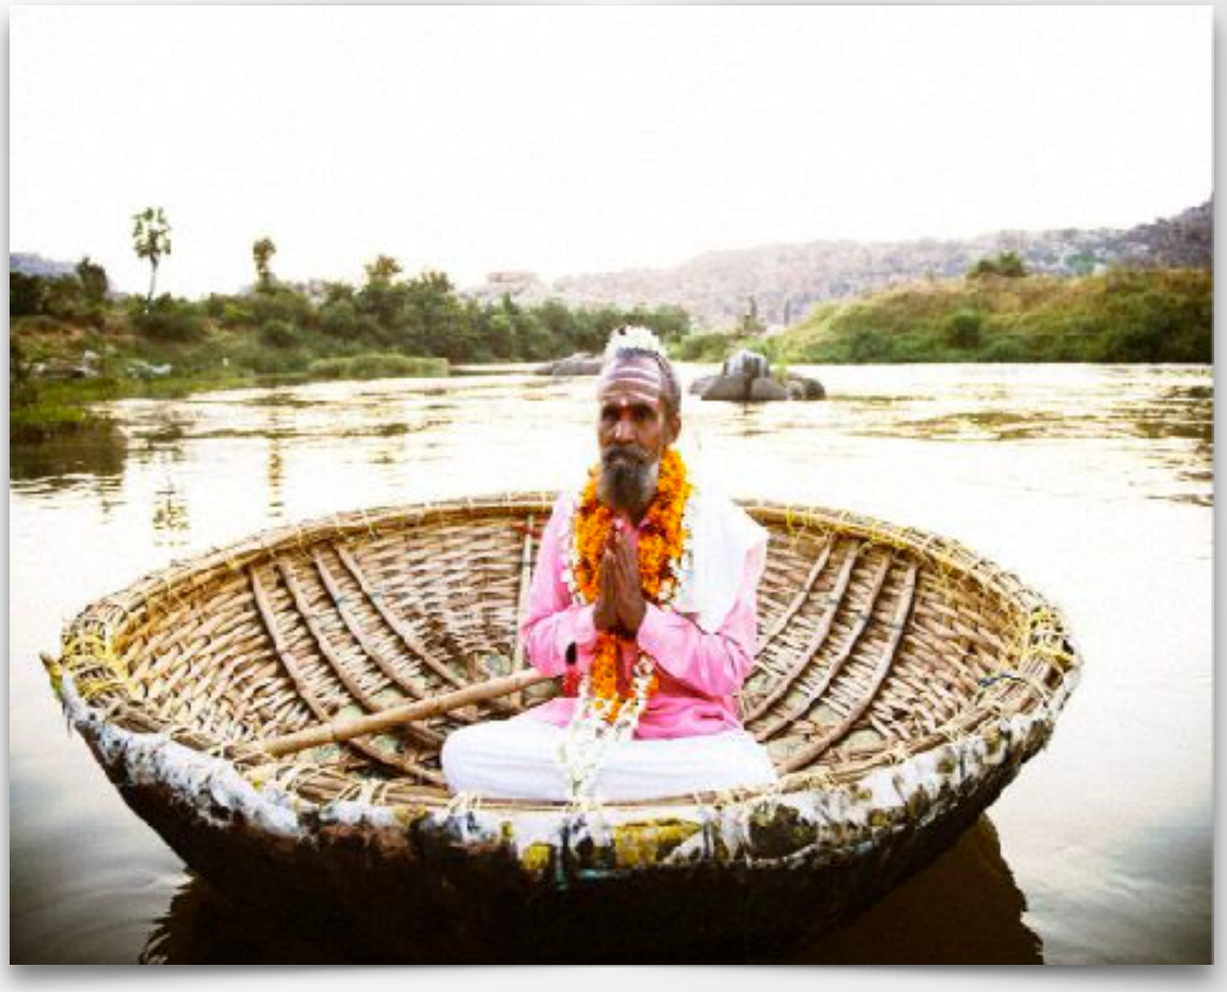
"The elephant, characterised more by recognition when encountered, than by definition"

Coin: Half Pence (1/2 pence) Obverse has the image of an elephant. Reverse bears the inscription.

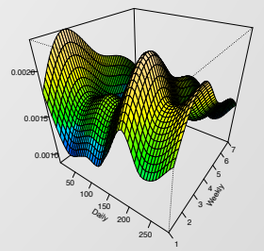


A priest and a scientist walk into a computer lab . . .

- commonly = *quant-monks* process info
- “Rechenknechte” (Gilbert Walker’s Indian helpers)
- “Computers” (i.e. women; HGL)



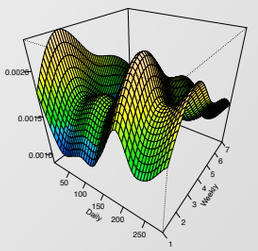
Fr. Roberto Busa (SJ): “The *difficult* we do right away; the *impossible* takes a little longer”.



A priest and a scientist walk into a computer lab . . .

- do the *monks* process info?
- or do *machines* work autonomously?
- Wetware vs. Software

Father Roberto Busa: “The *difficult* we do right away; the *impossible* takes a little longer”.



Intermezzo:
GAM or BEER?

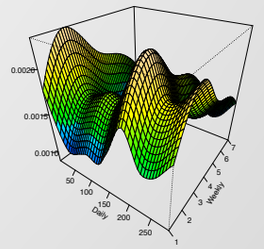
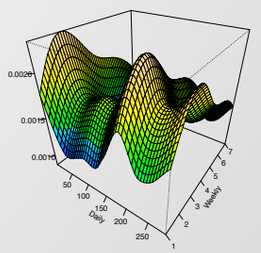
Algo-Puma (left) vs. Human-Puma (Right)



CC's = DeFi

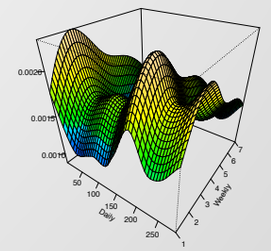
(a) Centralized (b) Decentralized (c) Distributed

Types of (finance) networks



ABCD-DNA:

- *on-demand* structures
- AI = software that mimics human cognitive functions
- BC, DL, SC = Distributed Ledger Technologies (DLT)
- CS = cloud computing, decentralization of server capacity & availability of data storage, processing power
- Data = *Fourth Industrial Revolution*, SDA, IoT, etc.



Hardware virtualization:

- software is hosted, updated, run decentrally
- only specific data that *needs* to be processed locally under specified conditions remains to be processed locally (e.g. hardware-bound access like hardware CC wallets)
- creation & set-up of DeFi architecture (“software as a service”)
